

Solutions from Microsoft

Better Together: Windows Mobile® 5.0 and Exchange Server 2003

Maintain your productivity on business trips or when working away from your desk with your Microsoft® Windows Mobile®-based device connecting to Exchange Server 2003. You can stay in touch with co-workers and clients, keep track of appointments and monitor your tasks from devices that are compact and easy-to-use. Windows Mobile®-based devices are directly integrated with Exchange Server 2003 through the Exchange ActiveSync protocol.

Exchange Direct Push Technology

Today with Exchange, you can configure your Active Sync-enabled mobile devices to synchronise with your Exchange server mailbox at intervals as frequent as every five minutes.

Configure your Pocket PC Phone Edition devices or Smartphone running either Microsoft® Windows Mobile® 2003 software or Windows Mobile® 2003 Second Edition to self-update using a companion feature called Always-up-to-date (AUTD).

With AUTD, a 'new e-mail' SMS message notification is sent to your device. Upon receiving this notification, your device will connect to the Exchange server and synchronise with your recently received e-mails messages.

Improved Mobile Messaging

The Messaging and Security Feature Pack for Windows Mobile® 5.0, together with Exchange Server 2003 Service Pack 2 (SP2), is the latest set of improvements to the Microsoft® mobile messaging solution. SP2 and the Feature Pack provide a better Microsoft® Office Outlook® Mobile experience while making it easier than ever for you to manage and control your devices.

Direct Push Technology keeps you up-to-date by delivering email messages, schedules, contacts and tasks directly over the air to your mobile device as they occur. You can react quickly to last-minute changes in schedules and manage your task lists even while away from your desk.

You can also use your mobile device to access full contact list details from your company address book, the Global Address List (GAL) - any time of the day or night.

With Exchange Server 2003, you've got the information infrastructure in place. Deploying Windows Mobile® - based devices enables you to use your existing investment in Exchange Server to help your mobile workers stay connected to the people and information they need to move the business forward.

Benefits include:

- **Lower costs**
Pre-built integration between Exchange Server and Windows Mobile®-based devices means there's no need to pay extra for additional server, subscription or client access fees to get direct access to Exchange Server data.
- **Greater productivity and effectiveness**
Windows Mobile®-based devices that are easy to use with familiar applications, enable mobile workers to be productive no matter where they are. Gain access to critical line-of-business applications from the same devices that deliver Direct Push e-mail messages.
- **Efficient management and security**
IT administrators can remotely manage devices and enforce select corporate IT policy over the air, such as mandating passwords, with measures to protect corporate data if devices are lost or stolen.
